

Assessment Brief 2025-2026

This document contains details for all 3 assessment components

Module Title:	Agile Web Engineering
Module Code:	CSC-44114

Assessment Component 1		
Assessment Type	Presentation	
Assessment Title	Team video presentation of developed Web application and Q&A	
Weighting (% of module mark)	75%	
Assessment Length (word count or equivalent)	20-minute video presentation, 10-minute Q&A in allocated time-slot	
Submission Deadline (date and time)	5/5/2026	1 pm
Format of Submission	MP4 on the KLE + Team Working Contract and Weekly Scrum Diaries on MS Teams	

Assessment Component 2		
Assessment Type	Group Assignment	
Assessment Title	Scrum Diaries	
Weighting (% of module mark)	10%	
Assessment Length (word count or equivalent)	Standard formatting template provided in advance.	
Submission Deadline (date and time)	15/5/2026	1 pm
Format of Submission	Weekly Scrum Diaries on MS Teams	

Assessment Component 3		
Assessment Type	Reflective Diary	
Assessment Title	Individual Reflective Diary	
Weighting (% of module mark)	15%	
Assessment Length (word count or equivalent)	Equivalent of around 800 words	

Submission Deadline (date and time)	15/5/2026	1 pm
Format of Submission	PDF on the KLE	

Type of GenAI Use Permitted in Assessment	You may use GenAI to edit your work (e.g. enhancing phrasing, tone and sentence structure). You are not permitted to use GenAI to generate new content (<i>unless specifically agreed with the module lead</i>).
Feedback Release Date	15 working days after submission
Staff contact details	Module leader Dr. Taimur Bakhshi Email me on: t.bakhshi@keele.ac.uk Or message via MS Teams Room: CR105

Assessment Overview

There are 3 pieces of summative assessment for this module:

1. Development of a web-based platform according to a given scenario, and presentation (group assessment)
2. Scrum diary (group assessment)
3. An Individual Reflective (individual assessment)

Assessment 1

Video Presentation of Web Application

The team must produce a **pre-recorded video presentation (20 minutes)** supported by slides, followed by a **live Q&A session (10 minutes)**. The presentation must document the team's design and skills development tasks and demonstrate the web application. The time slot for live Q&A via Teams following video presentation submission, will be communicated to each time following submission.

Content to include in video presentation:

Design and skills development tasks

- **Review of the designed web platform**
 - Comparison with similar interfaces and design patterns.
 - Explanation of how requirements were met.
- **Interface design and implementation**
 - Demonstration of responsive design across devices.

- Evidence of adherence to HCI guidelines and usability principles.
- **Full-stack development**
 - Explanation of front-end and back-end integration.
 - Demonstration of security technologies (e.g., authentication, role-based access).
- **User evaluation**
 - Summary of user testing methods.
 - Analysis of user experience feedback and improvements made.

Demonstrate the web application

You are expected to **briefly showcase the working of your K-Conference web application**. This means going beyond slides and narration to provide clear evidence of how the application works.

Code Submission Requirement

As part of **Assessment Component 1**, teams must submit the **source code of their web application**. This is a compulsory element of the final submission and will be used to verify the design, implementation, and security features demonstrated in the presentation.

Key points:

- **Repository Upload**
 - The code must be stored in a version-controlled repository (e.g., GitHub, GitLab, or OneDrive with version history).
 - A link to the repository must be included in the **final presentation slide deck** so examiners can access it directly.

The video presentation along with slide deck will need to be uploaded to Assessment 1 dropbox on KLE.

ILOs Assessed in Assessment 1

- **HCI & Design Patterns (ILO 1,2)** → Assessed through the review of the designed web platform, showing how design decisions align with usability principles and established patterns.
- **Interface Design & Creation (ILO 1,2)** → Demonstrated in the interface design and implementation section, including responsive design across devices.
- **Full-stack Development (ILO 1,2)** → Evidenced through explanation and demonstration of front-end and back-end integration in the application.
- **Security Integration (ILO 1,2)** → Shown through implementation of security features such as authentication, role-based access, and compliance with standards.

- **User Experience Evaluation (ILO 1,2)** → Tested through the user evaluation section, including testing methods, feedback analysis, and iterative improvements.

Assessment 2

Scrum Diaries

Weekly team working diaries (Scrum preparation), to a set template available in advance.

ILOs Assessed in Assessment 2

The Scrum Diaries contribute to the following ILOs:

- **HCI & Design Patterns (ILO 1,2)** → Teams record how design choices follow usability principles and established patterns during sprints.
- **Interface Design & Creation (ILO 1,2)** → Weekly entries capture progress on building responsive interfaces across devices.
- **Full-stack Development (ILO 1,2)** → Diaries document integration of front-end and back-end tasks, showing how features evolve sprint by sprint.
- **Security Integration (ILO 1,2)** → Security features (e.g., authentication, role-based access) must be logged as part of sprint activities
- **User Experience Evaluation (ILO 1,2)** → User testing and feedback cycles are noted, showing iterative improvement of the application.
- **Teamwork & Contributions (ILO 3)** → Diaries provide evidence of individual contributions, teamwork, and peer collaboration, supporting later peer review.

Assessment 3

Individual Reflective Report

An individual evaluation of teamwork including reflection on their own contributions, the contributions of others in their team (peer review), and a reflection on the agile web engineering concepts covered by the guest speakers (equivalent of around 800 words).

ILOs Assessed in Assessment 3

- **Teamwork & Contributions (ILO 3)** → Assessed through reflection on the student's own contributions, the contributions of others, and peer review evidence.
- **Agile Practice & Concepts (ILO 3)** → Evaluated through reflection on agile web engineering concepts discussed by guest speakers, and how these relate to the team's experience.

Assessment Criteria:

<https://www.keele.ac.uk/policyzone/data/assessmentcriterialevel3456ug/>

Feedback to Students:

Individual mark breakdown and feedback will be returned via the KLE within 15 working days of the deadline.

Inclusive Practice:

The assessment has been designed according to the principles of inclusive delivery wherever possible, with a specific focus on the following related to group work:

- We have provided contact details of all tutors to allow students to raise concerns.
- We have asked you to agree ground rules for team working and require you to create a team working contract.
- Via Scrum, we have asked you to ensure that a record is taken of key discussion points and actions.
- We have clarified how you will be assessed, including any involvement of group marks, peer review and individual performance.
- We have designed the assessment so that it is not dependent on all students participating.
- We have explained how you can raise concerns of non-engagement by other students and what the consequences of non-engagement would be.

Use of Artificial Intelligence (AI):

All students can use assistive AI tools to check spelling, grammar and punctuation (i.e., use of in-built spell checkers) in all written assessments excluding examinations and class tests, unless advised otherwise.

You may use GenAI to edit your work (e.g. enhancing phrasing, tone and sentence structure). You are not permitted to use GenAI to generate new content (*unless specifically agreed with the module lead*).

At the end of your work and before your reference list you must acknowledge your use of GenAI. For example: "I acknowledge the use of Microsoft Copilot (version GPT-4, Microsoft, <https://copilot.microsoft.com/>) to edit my sentence structure and phrasing".

Academic Misconduct:

Academic misconduct is doing something that could give you an unfair advantage in an assessment. It includes, but is not limited to, the following: plagiarism; collusion; contract cheating; cheating in an examination; falsification of data or sources; falsification of official documents or signatures. The University treats academic misconduct very seriously and penalties will be given for proven cases, including termination of studies in serious cases. It is therefore very important that you understand how to prepare and take assessments honestly. In order to assist you with this there are various resources and help available both as part of your programme of study and also centrally. For more information please visit:

<https://www.keele.ac.uk/students/academicandlearningsupport/appeals-conduct/studentacademicconduct/>

Academic Skills Support:

The Academic and Digital Skills team provide a range of additional online resources (e.g., study guides, Sways, Podcasts, workshops etc) to help you with your academic work and assessments. You can find more information [here](#).

Assessment Details

This document outlines what is required for **all 3 assessment components** for this module. **It is long and contains a lot of detail which is there to help you.** We suggest you read this on your own first and then discuss it in your Team. The overall aim of the coursework is:

- To provide you with knowledge and practice of typical techniques and processes used in team-based agile web engineering.
- To provide you with the opportunity to compare theory and methods that underpin software engineering (both from academia and industry) with your own experience of working in small teams.
- To experience agile web development.

Please note that the intention is not to learn about and experience the full agile web development lifecycle as that would be far too much for a 30-credit module. As you will hear from the invited industry speakers, practice in industry is wide and varied and it is more important that you understand the general structure of team working and agile development and have a taste of some of the techniques that are commonly used to solve and document different types of problems and software/systems.

*Please use the Workshops to ask questions. **We are here to support you during this coursework and give you formative feedback throughout.***

Assessment Scenario

K-Conference - Academic Conference Management Platform

You have been tasked with designing **K-Conference**, a web-based platform to support the end-to-end running of an academic conference (e.g., a 2–3 day international research event). K-Conference must support multiple stakeholders and provide clear workflows for event setup, paper submission, peer review, scheduling, participant registration, communications, and reporting. The platform should work for in-person, online, or hybrid conferences and be robust enough to handle peak usage around deadlines (submission, review, registration) and live sessions.

It will be up to you in the Workshops, in collaboration with the tutorial team, and through private study to ascertain and refine the key users and requirements of the tool, but in general it needs to support the following roles:

- **Authors:** submit papers, track submission status, receive reviewer feedback, and view acceptance/rejection decisions.
 - **Reviewers:** access assigned papers, provide structured reviews using rubrics, declare conflicts of interest, and submit recommendations.
 - **Organisers:** configure the event, manage submissions and reviews, publish schedules, oversee registrations, and generate reports.
 - **Participants:** register, access programme details, join sessions (online or in-person), receive updates, and provide feedback.
 - **Keynote Speakers / Sponsors (optional extensions):** manage keynote slots, sponsor sessions, and track engagement metrics.
-

Basic Functional Requirements

Event setup and configuration (Organisers)

- Enable organisers to create and configure a conference event, including:
 - dates/times, location(s) or online links, capacity limits, rules, and code of conduct
 - tracks/sessions and keynote slots
 - review rubrics (criteria, weightings, scoring scales)
 - a schedule of sessions (e.g., paper presentations, workshops, opening/closing ceremony, submission deadlines)

Registration and participation (Participants + Organisers)

- Enable participants to register for the conference and manage a simple profile.
- Provide organiser controls for managing capacity (e.g., approvals/waitlist) and exporting attendance lists.
- Enable event check-in (e.g., QR/manual) and attendance tracking (basic implementation sufficient).

Paper submission (Authors + Organisers)

- Enable authors to submit papers with typical conference artefacts, for example:
 - title, abstract, track/session, author list
 - manuscript file, supplementary materials, keywords
- Enforce submission deadlines (with organiser override capability where necessary).
- Support versioning or a submission “lock” so it is clear what was submitted at the deadline.

Reviewing and scoring (Reviewers + Organisers)

- Provide a reviewer portal to:
 - view assigned submissions
 - score/review using the rubric
 - leave structured feedback comments
 - record conflicts of interest and recuse themselves if required
- Provide organiser tools to:
 - monitor review progress
 - calculate acceptance/rejection decisions based on scoring
 - resolve ties or exceptional cases with a logged reason
- Enable publishing of outcomes (accepted papers, best paper awards) and optional feedback release to authors.

Communications and updates

- Provide announcements feature for organisers to broadcast updates to participants (e.g., schedule changes, reminders).
- Provide notifications (in-app is sufficient; email/push optional).
- Provide an FAQ / info area that can be updated during the event.

Analytics and reporting

- Provide reporting features for organisers, such as:
 - registration numbers over time, attendance, author demographics
 - submission counts and acceptance rates
 - review progress and rubric score distributions
- Reports should be viewable in-app and exportable (e.g., CSV/PDF optional depending on scope).

Non-functional Requirements

- **Security and privacy:** Role-based access control (authors vs reviewers vs organisers vs participants), safe handling of uploaded manuscripts/links, secure authentication, and appropriate protection of personal data.
- **Data protection and compliance:** Adopt GDPR-minded principles (data minimisation, retention, appropriate consent for optional fields such as accessibility needs). Clearly state what data is collected and why.

- **Fairness and integrity:** Protect review integrity (e.g., prevent unauthorised edits after deadlines, track overrides, manage conflicts of interest), and provide transparency on rubric use.
- **Auditability:** Maintain audit logs for critical actions (deadline changes, submission unlocks/overrides, review overrides, admin actions).
- **Performance and scalability:** The system must remain usable during peak periods (e.g., right before submission deadlines or registration cut-offs). Consider caching, queuing, or graceful degradation if relevant.
- **Availability and resilience:** Consider failure modes (network issues, partial outages) and how the platform behaves under stress; define acceptable uptime during the conference window.
- **Accessibility and usability:** The platform should be usable on mobile devices and accessible (keyboard navigation, readable layouts, screen reader compatibility).
- **Maintainability:** The system should be structured for change (conferences differ each time), with clear modular design, testing strategy, and deployment approach.

This is the basic functionality required but you may identify more where appropriate. Within this basic functionality, there are a number of things you will need to consider carefully, and we urge you to work with the module teaching team to fully understand these requirements and ask questions when you are unsure (as we are in effect potential users of this tool, in the same way you are).

Spend time in your team trying to understand what is required of the tool and identify useful areas of research that you could undertake (this may make a good first task to divide amongst your team). This should be enough information to get you started. However, you can ask clarifying questions to the teaching team in the weekly Workshops and via email/MS Teams to the module lead.

N.B. As this is a “real world” project, with no predetermined model answer, where appropriate we may update this coursework specification to provide further clarification and you will be informed about this if it happens.

Assessment Component 1

Team Video Presentation of Developed Web Application K-Conference

(weighted 75%)

This assessment develops teamwork within the Scrum Framework and provides experience of agile web engineering in practice. It focuses on exploring the **K-Conference platform requirements** and presenting the team’s final web application. Teams will complete two sprints, with the second culminating in a video presentation that demonstrates how the application meets the module’s Intended Learning Outcomes.

Required Deliverables

Your team video presentation of the final web application supported by a slide deck and must include:

1. Review of the Designed Web Platform

- Comparison with similar interfaces and design patterns.
- Explanation of how requirements were met.

2. Interface Design and Implementation

- Demonstration of responsive design across devices.
- Evidence of adherence to HCI guidelines and usability principles.

3. Full-stack Development

- **Explanation of front-end and back-end integration**
Teams should describe how the user interface (front-end) communicates with the server-side logic (back-end). This includes explaining the technologies used (e.g., HTML/CSS/JavaScript frameworks for the front-end, Node.js/PHP/Python for the back-end) and how data flows between them through APIs or database queries.
- **Demonstration of how features were implemented across the stack** The presentation should show specific examples of features that span both layers, such as:
 - A registration form that validates input on the front-end and stores user data securely in the back-end database.
 - A paper submission workflow where uploaded files are handled by the back-end, but the front-end provides feedback to the user.
 - A dashboard interface that retrieves data from the back-end and displays it dynamically to organisers or reviewers.

Evidence should demonstrate that the team can design, build, and integrate both sides of the application into a coherent, functional whole.

4. Security Integration

- Demonstration of security technologies (e.g., authentication, role-based access).
- Evidence of compliance with secure design principles.

5. User Evaluation

- Summary of user testing methods.
- Analysis of user experience feedback and improvements made.

You are expected to **briefly showcase the working of your K-Conference web application in the video presentation**. This means going beyond slides and narration to provide clear evidence of how the application works.

Code Submission Requirement

- Source code must be well-structured, documented, and stored in a version-controlled repository.
- Commit history should reflect team collaboration.
- Code must demonstrate integration of design, full-stack development, and security features.
- *A link to the repository* must be included in the final presentation slide deck.

Submission Instructions

- Submit one video per team, maximum 20 minutes, as an MP4 file via the KLE dropbox before **1 pm on 5 May 2026**. *You will afterwards be invited to attend a ten minute Q&A via Teams.*
- Accompany the video with the slide deck used in the presentation (PDF).
- Clearly state your team name in the video and only include the names of members who contributed.
- The video should comprise slides with narration explaining assumptions, interpretations, and evidence of the application.
- Do not simply read slide content; provide explanation and justification.

HINT: an obvious way to create the video is to write PowerPoint slides showing deliverables, and to use Slideshow-Record to narrate the slides followed by a brief demonstration of the web application – K-Conference. Please create a MP4 file accompanied by the slide deck, before uploading to the submission dropbox on the KLE.

Assessment 1: Marking Rubric

Criterion	Focus	Marks
Presentation & Professionalism	Clear, well-structured video; professional slides; effective narration; within time limit. Demonstrates ability to communicate design and development decisions effectively.	5
Review of the	Explanation of how requirements were met;	15

Designed Web Platform	evidence of adherence to HCI guidelines.	
Interface Design & Implementation	Demonstration of responsive design across devices; clarity of interface choices; usability principles applied.	15
Full-stack Development	Explanation of front-end and back-end integration; demonstration of features spanning both layers (e.g., registration, submission, dashboard); evidence of coherent integration across the stack.	15
Security Integration	Demonstration of security technologies (authentication, role-based access); evidence of compliance with secure design principles.	10
User Evaluation	Summary of user testing methods; analysis of user experience feedback; evidence of iterative improvements.	10
Demonstration of the Web Application	Clear presentation of the application in action. The demonstration should highlight practical functionality and justify choices.	20
Code Submission	Source code is well-structured, documented, and stored in a version-controlled repository; commit history reflects collaboration; repository link included in slide deck.	10

Assessment Component 2

Team Scrum Diaries (**weighted 10%**)

Your team is required to complete the **Scrum Roles and Diary template each week** throughout this Teamwork Assessment Component.

- there is a word template for the **Scrum Roles and Diary** on the module KLE assessments area.
- each week, you extend your diary with the current week's information (you may create a new copy and extend it, or just change the name and extend it, depending on what is useful for your team)
- you get the diary marks IF, for each required week, your diary is (a) appropriately completed; and (b) shows appropriate use of Scrum and evidence of rotation of roles.
- there is information in week 1's tutorials on Scrum directed reading about the purpose of the diaries.

This component offers a chance to develop team working, with greater autonomy in developing use of the Scrum Framework to manage agile team software design. Also it gives experience of the middle stages of agile web engineering, that precede code-and-test activities, using contemporary, agile-focused approaches

N.B. In reality, you would not use Microsoft Word to document a Scrum process. If there is a software package, online tool etc. that you identify as a team that can document the same information as this template, and you can share a weekly version with the module team, then you can use that instead. However, please confirm this with Dr. Taimur Bakhshi (t.bakhshi@keele.ac.uk)

Assessment 2: Marking Rubric

Criterion	Focus	Marks
Completion & Consistency	Required 6 weeks completed; diary entries consistently maintained and extended each week.	25
Appropriate Use of Scrum	Evidence of applying Scrum framework correctly (roles, ceremonies, artefacts). Demonstrates understanding of agile team processes.	25
Rotation of Roles	Clear evidence of rotating Scrum roles (Scrum Master, Product Owner, Developer). Balanced participation across team members.	20
Quality of Entries	Entries are detailed, reflective, and relevant; show progression of teamwork and agile practice. Avoid superficial or minimal notes.	20
Presentation & Professionalism	Diaries are clearly structured, well-formatted (Word template or approved tool), easy to follow, and professionally presented.	10

Assessment Component 3

Individual Reflective Diary (weighted 15%)

This is a short individual report reflecting on given aspects of teamworking and completion of peer review forms.

- This is the only individual submission.
- Note that you must submit the individual component to get the whole marks for the teamwork.

The individual report must be submitted as a PDF file in the dropbox on the KLE before 1pm on 15/5/2026.

General points

- The report is not an essay. Please write succinct answers, that precisely meet the brief. You will not get marks for writing about things that are irrelevant.
- Use subheadings, bullets and tables to make your answer easy to read: do not leave the marker to guess what you mean or what is relevant.

- The word limit is a limit not a target. You are marked on quality, not length. The limits are there to ensure that you write concisely and select your points carefully.
- The Bibliography (reference list) is not included in the word limit for either question. This is so you do not have to compromise the quality of referencing to meet limits.

Anonymity

Do not use any other team member's real name or other identifier. If you refer to people, label them as Person A, Person B, etc. If you identify any other student in the text of your answer, you will lose 20 percent of your achieved mark for this assessment component. You can (and should) refer by name to specific Industry Speakers where relevant.

Assessment 3: Marking Rubric

Criterion	Focus	Marks
Presentation & Structure	Professional layout, clear organisation, logical flow, effective use of headings/bullets, readability	15
Industry Speakers Reflection	Summarises surprising insights vs. directed reading/viewing (5 marks) and identifies areas for further development (5 marks). Clear, concise reflection.	10
Personal Challenges & Moving Forward	Identifies one strength and one weakness in teamwork (2 marks each), reflects on teammates' reactions (2 marks), and outlines strategies to address weakness/maximise strength in future Scrum projects (2 marks each).	10
Depth of Reflection & Critical Analysis	Goes beyond description to analyse experiences, challenges, and outcomes. Shows awareness of strengths, weaknesses, and growth. Thoughtful, critical reflection.	35
Application of Theory & Evidence of Learning	Connects experiences to relevant theories/frameworks (Agile, UI/UX, usability, etc.). Provides examples of activities, progression of skills, and use of feedback.	30

Penalties for non-engagement

The module aims to support students in learning and experiencing teamworking. However, it is not appropriate for students to achieve marks that do not reflect a contribution to the team.

In assessment components 1 and 2, students who are judged not to have participated in the teamwork will receive a reduced mark (including zero if deemed appropriate). Decisions on mark reductions are normally made after discussion with the team (where possible), the individual concerned (where possible) and informed by the *Student Peer Evaluation Forms* and attendance register.

Problems that are not notified immediately, during teamworking, cannot be investigated or addressed: do not wait until close to or after submission to complain!

Because those not participating will be penalised, it is important for individuals and teams to understand and follow the following guidance.

1. The weekly diary must accurately record participation and reasons for absence: it is not a requirement for all students to attend all meetings, but it is essential that all team members communicate and participate in teamwork.
2. Individuals who experience personal challenges that affect their participation should contact the module lead as soon as possible.
3. Teams experiencing problems related to participation and completion of work should contact the module lead as soon as possible.
4. If you, as a team or individual, do not understand what you are expected to do, please discuss with the module lead as soon as possible (as a team or as an individual).

The module team will endeavour to advise, mediate, liaise, and manage issues arising from personal challenges, and to reach appropriate adjustments of marks with teams and individuals.
